To: Chen, Feng <fchen5@albany.edu>;

$$\textcircled{1} \quad x_2 = m \cdot x_1 + b$$

$$\textcircled{2} \quad x = x^0 + \lambda \cdot v, \quad x = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix}$$

$$\boxed{\textcircled{3} \quad x \cdot w + b = 0}$$

- A. w is perpendicular to the line
 B. $\frac{|b|}{\|w\|_2}$ is the distance from the line to the origin.

- ① move the line in parallel ~~to~~ towards the direction of w .
- ② the moved distance along the direction of w is

$$\frac{|c|}{\|w\|_2}$$

why?

$$\frac{\|b-c\|}{\|w\|_2} - \frac{\|b\|}{\|w\|_2} = \frac{|c|}{\|w\|_2}$$

$$x_2 = w \cdot x_1 + b$$

$$x = x^0 + \lambda \cdot v, \quad x = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix}$$

$$w \cdot x + b = 0$$

\Downarrow

$$w \cdot x + b = 0$$

w is perpendicular to the line

$\frac{|b|}{\|w\|_2}$ is the distance from the line to the origin

parallel lines \Downarrow

$$w \cdot x + b = 0$$

move towards the direction of w

$$w \cdot x + b = \pm c, \quad c > 0$$

move towards the reverse direction of w

move distance: $\frac{c}{\|w\|_2}$

separating line given three points

$$\begin{aligned} w \cdot x^1 + b &= -1 \\ w \cdot x^2 + b &= -1 \\ w \cdot x^3 + b &= 1 \end{aligned} \Rightarrow \frac{w \cdot b}{\|w\|_2} \Rightarrow w \cdot x + b = 0$$

distance of a point x^0 to

a line $w \cdot x + b = 0$

If x^0 , the distance is

$$\frac{|w \cdot x^0 + b|}{\|w\|_2}$$
